File Backup and Recovery

WITH BACKUP ANALYZER

at-a-glance

BACKUP   **MANAGE**   **REPLICATE**   **RECOVER**   **PHYSICAL**   **VIRTUAL**   **CLOUD**

Manage Anywhere

An easy to use web-based interface for centralized installation, deployment, configuration, monitoring and reporting.

Features

- The dashboard licenses, installs, configures, monitors and manages backups from one central location
- Backup configurations can be created and applied to a single computer or to thousands with the click of a button
- Changes to backup configurations can be made with no disruption to end-users
- End-user reporting reminds clients about the value of your backup services

Intelligent Analytics

Not all data is equal. The Backup Analyzer provides intelligent data analysis to identify data that should and should not be backed up

Features

- Powerful data analytics identifies what data should be backed up and what data should be excluded from backups
- Helps suggest additional data that might be important to the end-user for the backup configuration
- Powerful monitoring features ensure backups are operating properly

Data Backup

Partners can choose the protection level that makes the most sense for different data types.

Features

- Efficiently and reliably backup data for mobile and remote users
- Enables the backup of files that are in use or locked
- Supports unlimited file revisions so clients can recover previous versions of their data
- Data is stored encrypted and compressed in secure Tier III SSAE 16, PCI, and HIPAA / HITECH audited data centers

Data Recovery

Allows faster recovery of critical data without the need to sort through unnecessary files.

Features

- Data analytics increases the speed of recovery
- Easily recover individual files and folders from the familiar Windows interface
- Restore previous revisions of files that were inadvertently saved or deleted
- Enables backup and recovery of critical organizational data on machines that are not regularly protected
